STANDAARD VELGEN KWALITEITS TESTS

Zodra uw velgen zijn geproduceerd worden ze machinaal getest d.m.v. drie stappen. Dit om er zeker van te zijn dat de velg aan de minimale eisen voldoet. Al onze velgen zijn gecertificeerd. [\(TUV/JWL/VIA/TSE/SFI/TS16949\)](#)

1. Radiale belasting

De Radiale vermoeidheidstest is bedoeld om de structurele prestaties van een wiel voor normaal snelweggebruik op personenauto's, lichte vrachtwagens en multifunctionele voertuigen te bepalen. Het wiel moet bestand zijn tegen herhaalde radiale belasting gedurende een bepaald aantal cycli om de test te doorstaan

2. Buigbelasting

Het doel van buigtesten ligt in het vermogen om de flexibiliteit en duurzaamheid van materialen, met name metalen, te evalueren. Deze mechanische test is essentieel voor het bepalen van de ductiliteit van een materiaal, of het vermogen om te vervormen zonder te breken

3. Impact test

Test van het vermogen van een materiaal om impact te weerstaan, gebruikt door ingenieurs om het gedrag ervan onder werkelijke omstandigheden te voorspellen. Aangezien alle velgen op bestelling worden gemaakt kunnen wij geen snellere levertijden bieden dan bovenstaand.
